Abstract

In this article, we study the existence of coupled coincidence points for multi-valued nonlinear contractions in partially ordered metric spaces. We do it from two different approaches, the first is Δ-symmetric property recently studied in Samet and Vetro (Coupled fixed point theorems for multi-valued nonlinear contraction mappings in partially ordered metric spaces, Nonlinear Anal. **74**, 4260-4268 (2011)) and second one is mixed *g*-monotone property studied by Lakshmikantham and Ćirić (Coupled fixed point theorems for nonlinear contractions in partially ordered metric spaces, Nonlinear Anal. **70**, 4341-4349 (2009)).

The theorems presented extend certain results due to Ćirić (Multi-valued nonlinear contraction mappings, Nonlinear Anal. **71**, 2716-2723 (2009)), Samet and Vetro (Coupled fixed point theorems for multi-valued nonlinear contraction mappings in partially ordered metric spaces, Nonlinear Anal. **74**, 4260-4268 (2011)) and many others. We support the results by establishing an illustrative example.

Keywords: coupled coincidence points, partially ordered metric spaces, compatible maps, multi-valued nonlinear contraction mappings

1. Introduction and preliminaries

Let (X, d) be a metric space. We denote by $CB(X)$ the collection of non-empty closed bounded subsets of X. For $A, B \in CB(X)$ and $x \in X$, suppose that

$$D(x, A) = \inf_{a \in A} d(x, a) \quad \text{and} \quad H(A, B,) = \max\{\sup_{a \in A} D(a, B), \sup_{b \in B} D(b, A)\}.$$

Such a mapping H is called a Hausdorff metric on $CB(X)$ induced by d.

Definition 1.1. *An element $x \in X$ is said to be a fixed point of a multi-valued mapping $T: X \to CB(X)$ if and only if $x \in Tx$.*

In 1969, Nadler [1] extended the famous Banach Contraction Principle from single-valued mapping to multi-valued mapping and proved the following fixed point theorem for the multi-valued contraction.

Theorem 1.1. *Let (X, d) be a complete metric space and let T be a mapping from X into $CB(X)$. Assume that there exists $c \in [0,1)$ such that $H(Tx, Ty) \leq cd(x, y)$ for all $x,y \in X$. Then, T has a fixed point.*

The existence of fixed points for various multi-valued contractive mappings has been studied by many authors under different conditions. In 1989, Mizoguchi and Takahashi [2] proved the following interesting fixed point theorem for a weak contraction.

Theorem 1.2. *Let* (X,d) *be a complete metric space and let* T *be a mapping from* X *into* $CB(X)$. *Assume that* $H(Tx, Ty) \leq \alpha(d(x,y))\, d(x,y)$ *for all* $x,y \in X$, *where* α *is a function from* $[0,\infty)$ *into* $[0,1)$ *satisfying the condition* $\limsup_{s\to t^+}\alpha(s) < 1$ *for all* $t \in [0,\infty)$. *Then, T has a fixed point.*

Let $CL(X) := \{A \subset X | A \neq \Phi, \bar{A} = A\}$, where $\bar{A}$ denotes the closure of A in the metric space (X, d). In this context, Ćirić [3] proved the following interesting theorem.

Theorem 1.3. *(See* [3]*) Let* (X,d) *be a complete metric space and let* T *be a mapping from* X *into* $CL(X)$. *Let* $f: X \to \mathbb{R}$ *be the function defined by* $f(x) = d(x, Tx)$ *for all* $x \in X$. *Suppose that f is lower semi-continuous and that there exists a function* $\varphi: [0, +\infty) \to [a, 1)$, $0 < a < 1$, *satisfying*

$$\limsup_{r\to t^+}\phi(r) < 1 \quad \text{for each } t \in [0, +\infty). \tag{1.1}$$

Assume that for any $x \in X$ *there is* $y \in Tx$ *satisfying the following two conditions:*

$$\sqrt{\phi(f(x))}d(x,y) \leq f(x) \tag{1.2}$$

such that

$$f(y) \leq \phi(f(x))d(x,y). \tag{1.3}$$

Then, there exists $z \in X$ *such that* $z \in Tz$.

Definition 1.2. [4]*Let X be a non-empty set and* $F: X \times X \to X$ *be a given mapping. An element* $(x, y) \in X \times X$ *is said to be a coupled fixed point of the mapping F if* $F(x, y) = x$ *and* $F(y, x) = y$.

Definition 1.3. [5]*Let* $(x,y) \in X \times X$, $F: X \times X \to X$ *and* $g: X \to X$. *We say that* (x,y) *is a coupled coincidence point of F and g if* $F(x,y) = gx$ *and* $F(y, x) = gy$ *for* $x,y \in X$.

Definition 1.4. *A function* $f: X \times X \to \mathbb{R}$ *is called lower semi-continuous if and only if for any sequence* $\{x_n\} \subset X$, $\{y_n\} \subset X$ *and* $(x,y) \in X \times X$, *we have*

$$\lim_{n\to\infty}(x_n, y_n) = (x, y) \Rightarrow f(x, y) \leq \liminf_{n\to\infty} f(x_n, y_n).$$

Let (X, d) be a metric space endowed with a partial order and $G: X \to X$ be a given mapping. We define the set $\Delta \subset X \times X$ by

$$\Delta := \{(x, y) \in X \times X | G(x) \preccurlyeq G(y)\}.$$

In [6], Samet and Vetro introduced the binary relation R on $CL(X)$ defined by

$$ARB \Leftrightarrow A \times B \subseteq \Delta,$$

where $A, B \in CL(X)$.

Definition 1.5. *Let* $F: X \times X \to CL(X)$ *be a given mapping. We say that F is a* Δ*-symmetric mapping if and only if* $(x,y) \in \Delta \Rightarrow F(x,y)RF(y,x)$.

Example 1.1. *Suppose that* $X = [0,1]$, *endowed with the usual order* $\leq$. *Let* $G: [0,1] \to [0,1]$ *be the mapping defined by* $G(x) = M$ *for all* $x \in [0,1]$, *where M is a constant in* $[0,1]$. *Then,* $\Delta = [0,1] \times [0,1]$ *and F is a* Δ*-symmetric mapping.*

Definition 1.6. [6]*Let* $F: X \times X \to CL(X)$ *be a given mapping. We say that* $(x,y) \in X \times X$ *is a coupled fixed point of F if and only if* $x \in F(x,y)$ *and* $y \in F(y,x)$.

Definition 1.7. *Let F*: $X \times X \to CL(X)$ *be a given mapping and let g*: $X \to X$. *We say that* $(x,y) \in X \times X$ *is a coupled coincidence point of F and g if and only if* $gx \in F(x,y)$ *and* $gy \in F(y,x)$.

In [6], Samet and Vetro proved the following coupled fixed point version of Theorem 1.3.

Theorem 1.4. *Let* (X, d) *be a complete metric space endowed with a partial order* $\preccurlyeq$. *We assume that* $\Delta \neq \emptyset$, *i.e., there exists* $(x_0,y_0) \in \Delta$. *Let F*: $X \times X \to CL(X)$ *be a* Δ*-symmetric mapping. Suppose that the function f*: $X \times X \to [0,+\infty)$ *defined by*

$$f(x,y) := D(x, F(x,y)) + D(y, F(y,x)) \quad \text{for all } x, y \in X$$

is lower semi-continuous and that there exists a function φ: $[0, \infty) \to [a, 1)$, $0 < a < 1$, *satisfying*

$$\limsup_{r \to t^+} \phi(r) < 1 \quad \text{for each } t \in [0, +\infty).$$

Assume that for any $(x,y) \in \Delta$ *there exist* $u \in F(x,y)$ *and* $v \in F(y,x)$ *satisfying*

$$\sqrt{\phi(f(x,y))}[d(x,u) + d(y,v)] \leq f(x,y)$$

such that

$$f(u,v) \leq \phi(f(x,y))[d(x,u) + d(y,v)].$$

Then, F admits a coupled fixed point, i.e., there exists $z = (z_1, z_2) \in X \times X$ *such that* $z_1 \in F(z_1, z_2)$ *and* $z_2 \in F(z_2, z_1)$.

In 2006, Bhaskar and Lakshmikantham [4] introduced the notion of a coupled fixed point and established some coupled fixed point theorems in partially ordered metric spaces. They have discussed the existence and uniqueness of a solution for a periodic boundary value problem. Lakshmikantham and Ćirić [5] proved coupled coincidence and coupled common fixed point theorems for nonlinear contractive mappings in partially ordered complete metric spaces using mixed *g*-monotone property. For more details on coupled fixed point theory, we refer the reader to [7-12] and the references therein. Here we study the existence of coupled coincidences for multi-valued nonlinear contractions using two different approaches, first is based on Δ-symmetric property recently studied in [6] and second one is based on mixed *g*-monotone property studied by Lakshmikantham and Ćirić [5]. The theorems presented extend certain results due to Ćirić [3], Samet and Vetro [6] and many others. We support the results by establishing an illustrative example.

2. Coupled coincidences by Δ-symmetric property

Following is the main result of this section which generalizes the above mentioned results of Ćirić, and Samet and Vetro.

Theorem 2.1. *Let* (X,d) *be a metric space endowed with a partial order* $\preccurlyeq$ *and* $\Delta \neq \emptyset$. *Suppose that F*: $X \times X \to CL(X)$ *is a* Δ*-symmetric mapping, g*: $X \to X$ *is continuous, gX is complete, the function f*: $g(X) \times g(X) \to [0, +\infty)$ *defined by*

$$f(gx, gy) := D(gx, F(x,y)) + D(gy, F(y,x)) \quad \text{for all } x, y \in X$$

is lower semi-continuous and that there exists a function φ: $[0, \infty) \to [a, 1)$, $0 < a < 1$, *satisfying*

$$\limsup_{r \to t^+} \phi(r) < 1 \quad \text{for each } t \in [0, +\infty). \tag{2.1}$$

Assume that for any $(x,y) \in \Delta$ *there exist* $gu \in F(x,y)$ *and* $gv \in F(y,x)$ *satisfying*

$$\sqrt{\phi(f(gx, gy))}[d(gx, gu) + d(gy, gv)] \le f(gx, gy) \tag{2.2}$$

such that

$$f(gu, gv) \le \phi(f(gx, gy))[d(gx, gu) + d(gy, gv)]. \tag{2.3}$$

Then, F and g have a coupled coincidence point, i.e., there exists $gz = (gz_1, gz_2) \in X \times X$ *such that* $gz_1 \in F(z_1, z_2)$ *and* $gz_2 \in F(z_2, z_1)$.

Proof. Since by the definition of φ we have $\varphi(f(x,y)) < 1$ for each $(x,y) \in X \times X$, it follows that for any $(x,y) \in X \times X$ there exist $gu \in F(x,y)$ and $gv \in F(y,x)$ such that

$$\sqrt{\phi(f(gx, gy))}d(gx, gu) \le D(gx, F(x, y))$$

and

$$\sqrt{\phi(f(gx, gy))}d(gy, gv) \le D(gy, F(y, x)).$$

Hence, for each $(x,y) \in X \times X$, there exist $gu \in F(x,y)$ and $gv \in F(y,x)$ satisfying (2.2).

Let $(x_0, y_0) \in \Delta$ be arbitrary and fixed. By (2.2) and (2.3), we can choose $gx_1 \in F(x_0, y_0)$ and $gy_1 \in F(y_0, x_0)$ such that

$$\sqrt{\phi(f(gx_0, gy_0))}[d(gx_0, gx_1) + d(gy_0, gy_1)] \le f(gx_0, gy_0) \tag{2.4}$$

and

$$f(gx_1, gy_1) \le \phi(f(gx_0, gy_0))[d(gx_0, gx_1) + d(gy_0, gy_1)]. \tag{2.5}$$

From (2.4) and (2.5), we can get

$$\begin{aligned} f(gx_1, gy_1) &\le \phi(f(gx_0, gy_0))[d(gx_0, gx_1) + d(gy_0, gy_1)] \\ &= \sqrt{\phi(f(gx_0, gy_0))}\{\sqrt{\phi(f(gx_0, gy_0))}[d(gx_0, gx_1) + d(gy_0, gy_1)]\} \\ &\le \sqrt{\phi(f(gx_0, gy_0))}f(gx_0, gy_0). \end{aligned}$$

Thus,

$$f(gx_1, gy_1) \le \sqrt{\phi(f(gx_0, gy_0))}f(gx_0, gy_0). \tag{2.6}$$

Now, since F is a Δ-symmetric mapping and $(x_0, y_0) \in \Delta$, we have

$$F(x_0, y_0)RF(y_0, x_0) \Rightarrow (x_1, y_1) \in \Delta.$$

Also, by (2.2) and (2.3), we can choose $gx_2 \in F(x_1, y_1)$ and $gy_2 \in F(y_1, x_1)$ such that

$$\sqrt{\phi(f(gx_1, gy_1))}[d(gx_1, gx_2) + d(gy_1, gy_2)] \le f(gx_1, gy_1)$$

and

$$f(gx_2, gy_2) \le \phi(f(gx_1, gy_1))[d(gx_1, gx_2) + d(gy_1, gy_2)].$$

Hence, we get

$$f(gx_2gy_2) \leq \sqrt{\phi(f(gx_1, gy_1))}f(gx_1, gy_1),$$

with $(x_2, y_2) \in \Delta$.

Continuing this process we can choose $\{gx_n\} \subset X$ and $\{gy_n\} \subset X$ such that for all $n \in \mathbb{N}$, we have

$$(x_n, y_n) \in \Delta, \quad gx_{n+1} \in F(x_n, y_n), \quad gy_{n+1} \in F(y_n, x_n), \tag{2.7}$$

$$\sqrt{\phi(f(gx_n, gy_n))}[d(gx_n, gx_{x+1}) + d(gy_n, gy_{n+1})] \leq f(gx_n, gy_n), \tag{2.8}$$

and

$$f(gx_{n+1}, gy_{n+1}) \leq \sqrt{\phi(f(gx_n, gy_n))}f(gx_n, gy_n). \tag{2.9}$$

Now, we shall show that $f(gx_n, gy_n) \to 0$ as $n \to \infty$. We shall assume that $f(gx_n, gy_n) > 0$ for all $n \in \mathbb{N}$, since if $f(gx_n, gy_n) = 0$ for some $n \in \mathbb{N}$, then we get $D(gx_n, F(x_n, y_n)) = 0$ which implies that $gx_n \in \overline{F(x_n, y_n)} = F(x_n, y_n)$ and $D(gy_n, F(y_n, x_n)) = 0$ which implies that $gy_n \in F(y_n, x_n)$. Hence, in this case, (x_n, y_n) is a coupled coincidence point of F and g and the assertion of the theorem is proved.

From (2.9) and $\varphi(t) < 1$, we deduce that $\{f(gx_n, gy_n)\}$ is a strictly decreasing sequence of positive real numbers. Therefore, there is some $\delta \geq 0$ such that

$$\lim_{n\to\infty} f(gx_n, gy_n) = \delta.$$

Now, we will prove that $\delta = 0$. Suppose that this is not the case; taking the limit on both sides of (2.9) and having in mind the assumption (2.1), we have

$$\delta \leq \limsup_{f(gx_n,gy_n)\to\delta^+} \sqrt{\phi(f(gx_n, gy_n))}\delta < \delta,$$

a contradiction. Thus, $\delta = 0$, that is,

$$\lim_{n\to\infty} f(gx_n, gy_n) = 0. \tag{2.10}$$

Now, let us prove that $\{gx_n\}$ and $\{gy_n\}$ are Cauchy sequences in (X, d). Suppose that

$$\alpha = \limsup_{f(gx_n,gy_n)\to 0^+} \sqrt{\phi(f(gx_n, gy_n))}.$$

Then, by assumption (2.1), we have $\alpha < 1$. Let q be such that $\alpha < q < 1$. Then, there is some $n_0 \in \mathbb{N}$ such that

$$\sqrt{\phi(f(gx_n, gy_n))} < q \quad \text{for each } n \geq n_0.$$

Thus, from (2.9), we get

$$f(gx_{n+1}, gy_{n+1}) \leq qf(gx_n, gy_n) \quad \text{for each } n \geq n_0.$$

Hence, by induction,

$$f(gx_{n+1}, gy_{n+1}) \leq q^{n+1-n_0}f(gx_{n0}, gy_{n_0}) \quad \text{for each } n \geq n_0. \tag{2.11}$$

Since $\varphi(t) \geq a > 0$ for all $t \geq 0$, from (2.8) and (2.11), we obtain

$$d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}) \leq \frac{1}{\sqrt{a}} q^{n-n_0} f(gx_{n_0}, gy_{n_0}) \quad \text{for each } n \geq n_0. \tag{2.12}$$

From (2.12) and since $q < 1$, we conclude that $\{gx_n\}$ and $\{gy_n\}$ are Cauchy sequences in (X,d).

Now, since gX is complete, there is a $w = (w_1, w_2) \in gX \times gX$ such that

$$\lim_{n\to\infty} gx_n = w_1 = gz_1 \quad \text{and} \quad \lim_{n\to\infty} gy_n = w_2 = gz_2 \tag{2.13}$$

for some z_1, z_2 in X. We now show that $z = (z_1, z_2)$ is a coupled coincidence point of F and g. Since by assumption f is lower semi-continuous so from (2.10), we get

$$0 \leq f(gz_1, gz_2) = D(gz_1, F(z_1, z_2)) + D(gz_2, F(z_2, z_1)) \leq \liminf_{n\to\infty} f(gx_n, gy_n) = 0.$$

Hence,

$$D(gz_1, F(z_1, z_2)) = D(gz_2, F(z_2, z_1)) = 0,$$

which implies that $gz_1 \in F(z_1, z_2)$ and $gz_2 \in F(z_2, z_1)$, i.e., $z = (z_1, z_2)$ is a coupled coincidence point of F and g. This completes the proof.

Now, we prove the following theorem.

Theorem 2.2. *Let* (X, d) *be a metric space endowed with a partial order* $\preccurlyeq$ *and* $\Delta \neq \emptyset$. *Suppose that* $F: X \times X \to CL(X)$ *is a* Δ*-symmetric mapping,* $g: X \to X$ is *continuous and* gX *is complete. Suppose that the function* $f: gX \times gX \to [0,+\infty)$ *defined in Theorem 2.1 is lower semi-continuous and that there exists a function* $\varphi: [0, +\infty) \to [a, 1)$, $0 < a < 1$, *satisfying*

$$\limsup_{r\to t+} \phi(r) < 1 \quad \textit{for each } t \in [0, \infty). \tag{2.14}$$

Assume that for any $(x,y) \in \Delta$, *there exist* $gu \in F(x,y)$ *and* $gv \in F(y,x)$ *satisfying*

$$\sqrt{\phi(d(gx, gu) + d(gy, gv))}[d(gx, gu) + d(gy, gv)] \leq D(gx, F(x, y)) + D(gy, F(y, x)) \tag{2.15}$$

such that

$$D(gu, F(u, v)) + D(gv, F(v, u)) \leq \phi(d(gx, gu) + d(gy, gv))[d(gx, gu) + d(gy, gv)]. \tag{2.16}$$

Then, F and g have a coupled coincidence point, i.e., there exists $z = (z_1, z_2) \in X \times X$ *such that* $gz_1 \in F(z_1, z_2)$ *and* $gz_2 \in F(z_2, z_1)$.

Proof. Replacing $\varphi(f(x,y))$ with $\varphi(d(gx, gu) + d(gy, gv))$ and following the lines in the proof of Theorem 2.1, one can construct iterative sequences $\{x_n\} \subset X$ and $\{y_n\} \subset X$ such that for all $n \in \mathbb{N}$, we have

$$(x_n, y_n) \in \Delta, \quad gx_{n+1} \in F(x_n, y_n), \quad gy_{n+1} \in F(y_n, x_n), \tag{2.17}$$

$$\begin{aligned} &\sqrt{\phi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))}[d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})] \\ &\leq D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n)) \end{aligned} \tag{2.18}$$

and

$$\begin{aligned} & D(gx_{n+1}, F(x_{n+1}, y_{n+1})) + D(gy_{n+1}, F(y_{n+1}, x_{n+1})) \\ & \leq \sqrt{\varphi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))}[D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n))] \end{aligned} \tag{2.19}$$

for all $n \geq 0$. Again, following the lines of the proof of Theorem 2.1, we conclude that $\{D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n))\}$ is a strictly decreasing sequence of positive real numbers. Therefore, there is some $\delta \geq 0$ such that

$$\lim_{n\to+\infty} \{D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n)) = \delta. \tag{2.20}$$

Since in our assumptions there appears $\varphi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))$, we need to prove that $\{d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})\}$ admits a subsequence converging to a certain η^+ for some $\eta \geq 0$. Since $\phi(t) \geq a > 0$ for all $t \geq 0$, from (2.18) we obtain

$$d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}) \leq \frac{1}{\sqrt{a}}[D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n))]. \tag{2.21}$$

From (2.20) and (2.21), we conclude that the sequence $\{d(gx_n, gx_{n+1})+d(gy_n, gy_{n+1})\}$ is bounded. Therefore, there is some $\theta \geq 0$ such that

$$\liminf_{n\to+\infty} \{d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})\} = \theta. \tag{2.22}$$

Since $gx_{n+1} \in F(x_n, y_n)$ and $gy_{n+1} \in F(y_n, x_n)$, it follows that

$$d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}) \geq D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n))$$

for each $n \geq 0$. This implies that $\theta \geq \delta$. Now, we shall show that $\theta = \delta$. If we assume that $\delta = 0$, then from (2.20) and (2.21) we have

$$\lim_{n\to+\infty} \{d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})\} = 0.$$

Thus, if $\delta = 0$, then $\theta = \delta$. Suppose now that $\delta > 0$ and suppose, to the contrary, that $\theta > \delta$. Then, $\theta - \delta > 0$ and so from (2.20) and (2.22) there is a positive integer n_0 such that

$$D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n)) < \delta + \frac{\theta - \delta}{4} \tag{2.23}$$

and

$$\theta - \frac{\theta - \delta}{4} < d(x_n, x_{n+1}) + d(y_n, y_{n+1}) \tag{2.24}$$

for all $n \geq n_0$. Then, combining (2.18), (2.23) and (2.24) we get

$$\begin{aligned} & \sqrt{\varphi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))}\left(\theta - \frac{\theta - \delta}{4}\right) \\ & < \sqrt{\varphi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))}[d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})] \\ & \leq D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n)) \\ & < \delta + \frac{\theta - \delta}{4} \end{aligned}$$

for all $n \geq n_0$. Hence, we get

$$\sqrt{\varphi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))} \leq \frac{\theta + 3\delta}{3\theta + \delta} \tag{2.25}$$

for all $n \geq n_0$. Set $h = \frac{\theta + 3\delta}{3\theta + \delta} < 1$. Now, from (2.19) and (2.25), it follows that

$$D(gx_{n+1}, F(x_{n+1}, y_{n+1}))+D(gy_{n+1}, F(y_{n+1}, x_{n+1})) \leq h[D(gx_n, F(x_n, y_n))+D(gy_n, F(y_n, x_n))]$$

for all $n \geq n_0$. Finally, since we assume that $\delta > 0$ and as $h < 1$, proceeding by induction and combining the above inequalities, it follows that

$$\begin{aligned}\delta &\leq D(gx_{n_0+k_0}, F(x_{n_0+k_0}, y_{n_0+k_0})) + D(gy_{n_0+k_0}, F(y_{n_0+k_0}, x_{n_0+k_0})) \\ &\leq h^{k_0} D(gx_{n_0}, F(x_{n_0}, y_{n_0})) + D(gy_{n_0}, F(y_{n_0}, x_{n_0})) < \delta\end{aligned}$$

for a positive integer k_0, which is a contradiction to the assumption $\theta > \delta$ and so we must have $\theta = \delta$. Now, we shall show that $\theta = 0$. Since

$$\theta = \delta \leq D(gx_n, F(x_n, y_n)) + D(gy_n, F(y_n, x_n)) \leq d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}),$$

so we can read (2.22) as

$$\liminf_{n\to+\infty}\{d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})\} = \theta^+.$$

Thus, there exists a subsequence $\{d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1})\}$ such that

$$\lim_{k\to+\infty} \{d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1})\} = \theta^+.$$

Now, by (2.14), we have

$$\limsup_{(d(gx_{n_k}, gx_{n_k+1})+d(gy_{n_k}, gy_{n_k+1}))\to\theta^+} \sqrt{\varphi(d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1}))} < 1. \tag{2.26}$$

From (2.19),

$$\begin{aligned}&D(gx_{n_k+1}, F(x_{n_k+1}, y_{n_k+1})) + D(gy_{n_k+1}, F(y_{n_k+1}, x_{n_k+1})) \\ &\leq \sqrt{\varphi(d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1}))}[D(gx_{n_k}, F(x_{n_k}, y_{n_k})) + D(gy_{n_k}, F(y_{n_k}, x_{n_k}))].\end{aligned}$$

Taking the limit as $k \to +\infty$ and using (2.20), we get

$$\begin{aligned}\delta &= \limsup_{k\to+\infty}\{D(gx_{n_k+1}, F(x_{n_k+1}, y_{n_k+1})) + D(gy_{n_k+1}, F(y_{n_k+1}, x_{n_k+1}))\} \\ &\leq \left(\limsup_{k\to+\infty} \sqrt{\varphi(d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1}))}\right) \\ &\quad (\limsup_{k\to+\infty}\{D(gx_{n_k}, F(x_{n_k}, y_{n_k})) + D(gy_{n_k}, F(y_{n_k}, x_{n_k}))\}) \\ &= \left(\limsup_{(d(gx_{n_k}, gx_{n_k+1})+d(gy_{n_k}, gy_{n_k+1}))\to\theta^+} \sqrt{\varphi(d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1}))}\right)\delta.\end{aligned}$$

From the last inequality, if we suppose that $\delta > 0$, we get

$$1 \leq \limsup_{(d(gx_{n_k}, gx_{n_k+1})+d(gy_{n_k}, gy_{n_k+1}))\to\theta+} \sqrt{\varphi(d(gx_{n_k}, gx_{n_k+1}) + d(gy_{n_k}, gy_{n_k+1}))},$$

a contradiction with (2.26). Thus, $\delta = 0$. Then, from (2.20) and (2.21) we have

$$\alpha = \limsup_{(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1})) \to 0+} \sqrt{\varphi(d(gx_n, gx_{n+1}) + d(gy_n, gy_{n+1}))} < 1.$$

Once again, proceeding as in the proof of Theorem 2.1, one can prove that $\{gx_n\}$ and $\{gy_n\}$ are Cauchy sequences in gX and that $z = (z_1, z_2) \in X \times X$ is a coupled coincidence point of F, g, i.e.

$$gz_1 \in F(z_1, z_2) \quad \text{and} \quad gz_2 \in F(z_2, z_1).$$

Example 2.3. Suppose that $X = [0,1]$, equipped with the usual metric $d: X \times X \to [0, +\infty)$, and $G: [0,1] \to [0,1]$ is the mapping defined by

$$G(x) = M \quad \text{for all } x \in [0, 1],$$

where M is a constant in [0,1]. Let $F: X \times X \to CL(X)$ be defined as

$$F(x, y) = \begin{cases} \frac{x^2}{4} & \text{if } y \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1], \\ \{\frac{15}{96}, \frac{1}{5}\} & \text{if } y = \frac{15}{32}. \end{cases}$$

Then, $\Delta = [0,1] \times [0,1]$ and F is a Δ-symmetric mapping. Define now $\phi: [0, +\infty) \to [0,1)$ by

$$\varphi(t) = \begin{cases} \frac{11}{12}t & \text{if } t \in [0, \frac{2}{3}], \\ \frac{11}{18} & \text{if } t \in (\frac{2}{3}, +\infty). \end{cases}$$

Let $g: [0,1] \to [0,1]$ be defined as $gx = x^2$. Now, we shall show that $F(x, y)$ satisfies all the assumptions of Theorem 2.2. Let

$$f(x, y) = \begin{cases} \sqrt{x} + \sqrt{y} - \frac{1}{4}(x + y) & \text{if } x, y \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1], \\ \sqrt{x} - \frac{1}{4}x + \frac{43}{160} & \text{if } x \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1] \text{ and } y = \frac{15}{32}, \\ \sqrt{y} - \frac{1}{4}y + \frac{43}{160} & \text{if } y \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1] \text{ and } x = \frac{15}{32}, \\ \frac{43}{80} & \text{if } x = y = \frac{15}{32}. \end{cases}$$

It is easy to see that the function

$$f(gx, gy) = \begin{cases} x + y - \frac{1}{4}(x^2 + y^2) & \text{if } x, y \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1], \\ x - \frac{1}{4}x^2 + \frac{43}{160} & \text{if } x \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1] \text{ and } y = \frac{15}{32}, \\ y - \frac{1}{4}y^2 + \frac{43}{160} & \text{if } y \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1] \text{ and } x = \frac{15}{32}, \\ \frac{43}{80} & \text{if } x = y = \frac{15}{32} \end{cases}$$

is lower semi-continuous. Therefore, for all $x, y \in [0,1]$ with $x, y \neq \frac{15}{32}$, there exist $gu \in F(x, y) = \{\frac{x^2}{4}\}$ and $gv \in F(y, x) = \{\frac{y^2}{4}\}$ such that

$$\begin{aligned} D(gu, F(u, v)) + D(gv, F(v, u)) &= \frac{x^2}{4} - \frac{x^4}{64} + \frac{y^2}{4} - \frac{y^4}{64} \\ &= \frac{1}{4}\left[\left(x + \frac{x^2}{4}\right)\left(x - \frac{x^2}{4}\right) + \left(y + \frac{y^2}{4}\right)\left(y - \frac{y^2}{4}\right)\right] \\ &\le \frac{1}{4}\left[\left(x + \frac{x^2}{4}\right) d(gx, gu) + \left(y + \frac{y^2}{4}\right) d(gy, gv)\right] \\ &\le \frac{1}{2}\max\left\{x + \frac{x^2}{4}, y + \frac{y^2}{4}\right\}[d(gx, gu) + d(gy, gv)] \\ &< \frac{11}{12}\max\left\{\left(x - \frac{x^2}{4}\right), \left(y - \frac{y^2}{4}\right)\right\}[d(gx, gu) + d(gy, gv)] \\ &\le \varphi(d(gx, gu) + d(gy, gv))[d(gx, gu) + d(gy, gv)]. \end{aligned}$$

Thus, for x, y ∈ [0,1] with $x, y \neq \frac{15}{32}$, the conditions (2.15) and (2.16) are satisfied. Following similar arguments, one can easily show that conditions (2.15) and (2.16) are also satisfied for $x \in [0, \frac{15}{32}) \cup (\frac{15}{32}, 1]$ and $y = \frac{15}{32}$. Finally, for $x = y = \frac{15}{32}$, if we assume that $gu = gv = \frac{15}{96}$, it follows that $d(gx, gu) + d(gy, gv) = \frac{15}{24}$.

Consequently, we get

$$\begin{aligned}\sqrt{\varphi(d(gx,gu)+d(gy,gv))}[d(gx,gu)+d(gy,gv)] &= \sqrt{\frac{11}{24}\cdot\frac{15}{24}}\cdot\frac{15}{24}\\ &< \frac{43}{80} = D(gx,F(x,y)) + D(gy,F(y,x))\end{aligned}$$

and

$$\begin{aligned}D(gu,F(u,v)) + D(gv,F(v,u)) &= 2\left|\frac{15}{96} - \frac{1}{4}\left(\frac{15}{96}\right)^2\right|\\ &< \frac{11}{12}\cdot\frac{15}{24}\cdot\frac{15}{24}\\ &= \varphi(d(gx,gu)+d(gy,gv))[d(gx,gu)+d(gy,gv)].\end{aligned}$$

Thus, we conclude that all the conditions of Theorem 2.2 are satisfied, and *F*, *g* admits a coupled coincidence point $z = (0, 0)$.

3. Coupled coincidences by mixed *g*-monotone property

Recently, there have been exciting developments in the field of existence of fixed points in partially ordered metric spaces (cf. [13-24]). Using the concept of commuting maps and mixed *g*-monotone property, Lakshmikantham and Ćirić in [5] established the existence of coupled coincidence point results to generalize the results of Bhaskar and Lakshmikantham [4]. Choudhury and Kundu generalized these results to compatible maps. In this section, we shall extend the concepts of commuting, compatible maps and mixed *g*-monotone property to the case when *F* is multi-valued map and prove the extension of the above mentioned results.

Analogous with mixed monotone property, Lakshmikantham and Ćirić [5] introduced the following concept of a mixed *g*-monotone property.

Definition 3.1. *Let* $(X, \preccurlyeq)$ *be a partially ordered set and* $F: X \times X \to X$ *and* $g: X \to X$. We say *F* has the *mixed g-monotone property if F is monotone g-non-decreasing in its first argument and is monotone g-non-increasing in its second argument, that is, for any x,y* ∈ *X,*

$$x_1, x_2 \in X, g(x_1) \preccurlyeq g(x_2) \quad \textit{implies} \quad F(x_1, y) \preccurlyeq F(x_2, y) \tag{3.1}$$

and

$$y_1, y_2 \in X, g(y_1) \preccurlyeq g(y_2) \quad \textit{implies} \quad F(x, y_1) \succcurlyeq F(x, y_2). \tag{3.2}$$

Definition 3.2. *Let* $(X, \preccurlyeq)$ *be a partially ordered set,* $F: X \times X \to CL(X)$ *and let* $g: X \to X$ *be a mapping. We say that the mapping F has the mixed g-monotone property if, for all* $x_1, x_2, y_1, y_2 \in X$ with $gx_1 \preccurlyeq gx_2$ *and* $gy_1 \succcurlyeq gy_2$*, we get for all* $gu_1 \in F(x_1, y_1)$ *there exists* $gu_2 \in F(x_2, y_2)$ *such that* $gu_1 \preccurlyeq gu_2$ *and for all* $gv_1 \in F(y_1,x_1)$ *there exists* $gv_2 \in F(y_2, x_2)$ *such that* $gv_1 \succcurlyeq z\, gv_2$.

Definition 3.3. *The mapping* $F: X \times X \to CB(X)$ *and* $g: X \to X$ *are said to be compatible if*

$$\lim_{n\to\infty} H(g(F(x_n, y_n)), F(gx_n, gy_n)) = 0$$

and

$$\lim_{n\to\infty} H(g(F(y_n, x_n)), F(gy_n, gx_n)) = 0,$$

whenever $\{x_n\}$ *and* $\{y_n\}$ *are sequences in* X, *such that* $x = \lim_{n\to\infty} gx_n \in \lim_{n\to\infty} F(x_n, y_n)$ *and* $y = \lim_{n\to\infty} gy_n \in \lim_{n\to\infty} F(y_n, x_n)$, *for all* $x, y \in X$ *are satisfied.*

Definition 3.4. *The mapping* $F: X \times X \to CB(X)$ *and* $g: X \to X$ *are said to be commuting if* $gF(x, y) \subseteq F(gx, gy)$ *for all* $x, y \in X$.

Lemma 3.1. [1]*If* $A,B \in CB(X)$ *with* $H(A, B) < \epsilon$, *then for each* $a \in A$ *there exists an element* $b \in B$ *such that* $d(a, b) < \epsilon$.

Lemma 3.2. [1]*Let* $\{A_n\}$ *be a sequence in* $CB(X)$ *and* $\lim_{n\to\infty} H(A_n, A) = 0$ *for* $A \in CB(X)$. *If* $x_n \in A_n$ *and* $\lim_{n\to\infty} d(x_n, x) = 0$, *then* $x \in A$.

Let $(X, \preccurlyeq)$ be a partially ordered set and d be a metric on X such that (X, d) is a complete metric space. We define the partial order on the product space $X \times X$ as:

for $(u,v),(x,y) \in X \times X$, $(u, v) \preccurlyeq (x, y)$ if and only if $u \preccurlyeq x$, $v \succcurlyeq y$.

The product metric on $X \times X$ is defined as

$$d((x_1, y_1), (x_2, y_2)) := d(x_1, x_2) + d(y_1, y_2) \quad \text{for all } x_i, y_i \in X (i = 1, 2).$$

For notational convenience, we use the same symbol d for the product metric as well as for the metric on X.

We begin with the following result that gives the existence of a coupled coincidence point for compatible maps F and g in partially ordered metric spaces, where F is the multi-valued mappings.

Theorem 3.1. *Let* $F: X \times X \to CB(X)$, $g: X \to X$ *be such that:*

(1) *there exists* $\kappa \in (0,1)$ *with*

$$H(F(x, y), F(u, v)) \le \frac{k}{2} d((gx, gy), (gu, gv)) \quad \textit{for all } (gx, gy) \succcurlyeq (gu, gv);$$

(2) *if* $gx_1 \preccurlyeq gx_2$, $gy_2 \preccurlyeq gy_1$, $x_i, y_i \in X (i = 1,2)$, *then for all* $gu_1 \in F(x_1, y_1)$ *there exists* $gu_2 \in F(x_2, y_2)$ *with* $gu_1 \preccurlyeq gu_2$ *and for all* $gv_1 \in F(y_1, x_1)$ *there exists* $gv_2 \in F(y_2, x_2)$ *with* $gv_2 \preccurlyeq gv_1$ *provided* $d((gu_1, gv_1), (gu_2, gv_2)) < 1$; *i.e. F has the mixed g-monotone property, provided* $d((gu_1, gv_1), (gu_2, gv_2)) < 1$;

(3) there *exists* $x_0, y_0 \in X$, *and some* $gx_1 \in F(x_0, y_0)$, $gy_1 \in F(y_0, x_0)$ *with* $gx_0 \preccurlyeq gx_1$, $gy_0 \succcurlyeq gy_1$ *such that* $d((gx_0, gy_0), (gx_1, gy_1)) < 1 - \kappa$, *where* $\kappa \in (0,1)$;

(4) *if a non-decreasing sequence* $\{x_n\} \to x$, *then* $x_n \le x$ *for all n and if a non-increasing sequence* $\{y_n\} \to y$, *then* $y \le y_n$ *for all n and gX is complete.*

Then, F and g have a coupled coincidence point.

Proof. Let x_0, $y_0 \in X$ then by (3) there exists $gx_1 \in F(x_0, y_0)$, $gy_1 \in F(y_0, x_0)$ with $gx_0 \preccurlyeq gx_1$, $gy_0 \succcurlyeq gy_1$ such that

$$d((gx_0, gy_0), (gx_1, gy_1)) < 1 - \kappa. \tag{3.3}$$

Since $(gx_0, gy_0) \preccurlyeq (gx_1, gy_1)$ using (1) and (3.3), we have

$$H(F(x_0, y_0), F(x_1, y_1)) \le \frac{\kappa}{2} d((gx_0, gy_0), (gx_1, gy_1)) < \frac{\kappa}{2}(1 - \kappa)$$

and similarly

$$H(F(y_0, x_0), F(y_1, x_1)) \le \frac{\kappa}{2}(1 - \kappa).$$

Using (2) and Lemma 3.1, we have the existence of $gx_2 \in F(x_1, y_1)$, $gy_2 \in F(y_1, x_1)$ with $x_1 \preccurlyeq x_2$ and $y_1 \succcurlyeq y_2$ such that

$$d(gx_1, gx_2) \le \frac{\kappa}{2}(1 - \kappa) \tag{3.4}$$

and

$$d(gy_1, gy_2) \le \frac{\kappa}{2}(1 - \kappa). \tag{3.5}$$

From (3.4) and (3.5),

$$d((gx_1, gy_1), (gx_2, gy_2)) \le \kappa(1 - \kappa). \tag{3.6}$$

Again by (1) and (3.6), we have

$$H(F(x_1, y_1), F(x_2, y_2)) \le \frac{\kappa^2}{2}(1 - \kappa)$$

and

$$D(F(y_1, x_1), F(y_2, x_2)) \le \frac{\kappa^2}{2}(1 - \kappa).$$

From Lemma 3.1 and (2), we have the existence of $gx_3 \in F(x_2, y_2)$, $gy_3 \in F(y_2, x_2)$ with $gx_2 \preccurlyeq gx_3$, $gy_2 \succcurlyeq gy_3$ such that

$$d(gx_2, gx_3) \le \frac{\kappa^2}{2}(1 - \kappa)$$

and

$$d(gy_2, gy_3) \le \frac{\kappa^2}{2}(1 - \kappa).$$

It follows that

$$d((gx_2, gy_2), (gx_3, gy_3)) \le \kappa^2(1 - \kappa).$$

Continuing in this way we obtain $gx_{n+1} \in F(x_n, y_n)$, $gy_{n+1} \in F(y_n, x_n)$ with $gx_n \preccurlyeq gx_{n+1}, gy_n \succcurlyeq gy_{n_1}$ such that

$$d(gx_n, gx_{n+1}) \leq \frac{\kappa^n}{2}(1-\kappa)$$

and

$$d(gy_n, gy_{n+1}) \leq \frac{\kappa^n}{2}(1-\kappa).$$

Thus,

$$d((gx_n, gy_n), (gx_{n+1}, gy_{n+1})) \leq \kappa^n(1-\kappa). \tag{3.7}$$

Next, we will show that $\{gx_n\}$ is a Cauchy sequence in X. Let $m > n$. Then,

$$\begin{aligned} d(gx_n, gx_m) &\leq d(gx_n, gx_{n+1}) + d(gx_{n+1}, gx_{n+2}) + d(gx_{n+2}, gx_{n+3}) + \cdots + d(gx_{m-1}, gx_m) \\ &\leq [\kappa^n + \kappa^{n+1} + \kappa^{n+2} + \cdots + \kappa^{m-1}]\frac{(1-\kappa)}{2} \\ &= \kappa^n[1 + \kappa + \kappa^2 + \cdots + \kappa^{m-n-1}]\frac{(1-\kappa)}{2} \\ &= \kappa^n\left[\frac{1-\kappa^{m-n}}{1-\kappa}\right]\frac{(1-\kappa)}{2} \\ &= \frac{\kappa^n}{2}(1-\kappa^{m-n}) < \frac{\kappa^n}{2}, \end{aligned}$$

because $\kappa \in (0,1)$, $1 - \kappa^{m-n} < 1$. Therefore, $d(gx_n, gx_m) \to 0$ as $n \to \infty$ implies that $\{gx_n\}$ is a Cauchy sequence. Similarly, we can show that $\{gy_n\}$ is also a Cauchy sequence in X. Since gX is complete, there exists $x, y \in X$ such that $gx_n \to gx$ and $gy_n \to gy$ as $n \to \infty$. Finally, we have to show that $gx \in F(x, y)$ and $gy \in F(y, x)$.

Since $\{gx_n\}$ is a non-decreasing sequence and $\{gy_n\}$ is a non-increasing sequence in X such that $gx_n \to x$ and $gy_n \to y$ as $n \to \infty$, therefore we have $gx_n \preccurlyeq x$ and $gy_n \succcurlyeq y$ for all n. As $n \to \infty$, (1) implies that

$$H(F(x_n, y_n), F(x, y)) \leq \frac{\kappa}{2}d((gx_n, gy_n), (gx, gy)) \to 0.$$

Since $gx_{n+1} \in F(x_n, y_n)$ and $\lim_{n\to\infty} d(gx_{n+1}, gx) = 0$, it follows using Lemma 3.2 that $gx \in F(x, y)$. Again by (1),

$$H(F(y_n, x_n), F(y, x)) \leq \frac{\kappa}{2}d((gy_n, gx_n), (gy, gx)) \to 0.$$

Since $gy_{n+1} \in F(y_n, x_n)$ and $\lim_{n\to\infty} d(gy_{n+1}, gy) = 0$, it follows using Lemma 3.2 that $gy \in F(y, x)$.

Theorem 3.2. *Let F: $X \times X \to CB(X)$, g: $X \to X$ be such that conditions (1)-(3) of Theorem 3.1 hold. Let X be complete, F and g be continuous and compatible. Then, F and g have a coupled coincidence point.*

Proof. As in the proof of Theorem 3.1, we obtain the Cauchy sequences $\{gx_n\}$ and $\{gy_n\}$ in X. Since X is complete, there exists $x, y \in X$ such that $gx_n \to x$ and $gy_n \to y$ as $n \to \infty$. Finally, we have to show that $gx \in F(x, y)$ and $gy \in F(y, x)$. Since the mapping F: $X \times X \to CB$ (X) and g: $X \to X$ are compatible, we have

$$\lim_{n\to\infty} H(g(F(x_n, y_n)), F(gx_n, gy_n)) = 0,$$

because $\{x_n\}$ is a sequence in X, such that $x = \lim_{n\to\infty} gx_{n+1} \in \lim_{n\to\infty} F(x_n, y_n)$ is satisfied. For all $n \geq 0$, we have

$$D(gx, F(gx_n, gy_n)) \leq D(gx, gF(x_n, y_n)) + H(gF(x_n, y_n), F(gx_n, gy_n)).$$

Taking the limit as $n \to \infty$, and using the fact that g and F are continuous, we get, $D(gx, F(x, y)) = 0$, which implies that $gx \in F(x, y)$.

Similarly, since the mapping F and g are compatible, we have

$$\lim_{n\to\infty} H(g(F(y_n, x_n)), F(gy_n, gx_n)) = 0,$$

because $\{y_n\}$ is a sequence in X, such that $y = \lim_{n\to\infty} gy_{n+1} \in \lim_{n\to\infty} F(y_n, x_n)$ is satisfied. For all $n \geq 0$, we have

$$D(gy, F(gy_n, gx_n)) \leq D(gy, gF(y_n, x_n)) + H(gF(y_n, x_n), F(gy_n, gx_n)).$$

Taking the limit as n $\to \infty$, and using the fact that g and F are continuous, we get $D(gy, F(y, x)) = 0$, which implies that $gy \in F(y, x)$.

As commuting maps are compatible, we obtain the following;

Theorem 3.3. *Let F: $X \times X \to CB(X)$, g: $X \to X$ be such that conditions (1)-(3) of Theorem 3.1 hold. Let X be complete, F and g be continuous and commuting. Then, F and g have a coupled coincidence point.*
